"Simplicity is the answer when I think about sustainability and technology. We don't always need something super technological to solve problems; less can be more. Less plastic, less packaging, a simpler and more natural life. This thought was what led me to photograph for the contest. At the same time, I am passionate about animals, the sea, and mainly whales. And here, I saw the opportunity to reconcile something I love with the answer to a more sustainable life. This sculpture, for me, summarizes in a playful and visual way the reminder that it is necessary to pay attention to the correct disposal of plastic and the importance of educating the population so that plastic does not end up being swallowed by animals.

“The subway, with its efficiency and low carbon footprint, represents a valuable alternative to fuel-powered modes of transport.

I began to reflect on how technology contributes to a more sustainable life. Until then, I wasn't convinced that technology played a significant role in this regard. With so many technological advances, fauna, flora, and many biomes are seriously affected.

And, immersed in this theme, I realized that the subway is a form of technology that contributes to a more sustainable life and other technologies, such as renewable energy systems, recycling, and waste management, among different ways that, contribute to a more sustainable life.”

“It is sometimes challenging to realize what nature represents in a big city. This photo, for me, in the middle of the afternoon, represents the best and most melancholy part of the day, a melancholy that is so difficult to be perceived on a daily basis, reflected in the purest water and stirred by the whirlwind of commitments, duties, and responsibilities of a busy day. In that little corner, watching the sky and the zillions of lights that illuminate us incessantly, I feel nature in its most significant proportion, renewing my energy and filling me with happiness and gratitude.”

"When I captured this image, I remembered a phrase from Carl Jung: "Whoever looks outside dreams. Whoever looks inside wakes up. At that moment, I felt the purest connection between nature, the universe, and human beings."

“The use of electric cars is a sustainable transport solution, but refueling vehicles is one of the challenges for us to adopt this model in our daily lives.

Technology allows us to be closer to this type of transport every day, and the supply points in malls are here to make life easier for users and to stay!”

“The photo was taken in a fruit market, in one of the most arid places on the planet, near the Dead Sea (Israel). When I took the photo, the merchant explained that the fruits had been planted in the desert with a drip irrigation technique. What was previously impossible has become possible with technology for planting fruits in an arid environment, collaborating with food security.”

"I took this photo during a college technical visit.

Being in that place, at that moment, awakened in me a feeling of the greatness of nature and made me see how we can use it sustainably and the duty to protect it.

I wanted to convey this message through photography, using the technology we carry in the palm of our hands. I believe that when people have this same vision and feeling, we will live in harmony with the environment because we are part of it!"
